Market cap

SEK 304M

FY25 revenue

-SEK 0.69

FY25 EPS

**Investment thesis:** Sivers is a 75-year-old Swedish semiconductor company at the intersection of three megatrends: AI datacenter optical interconnects (co-packaged optics), 5G/SATCOM mmWave, and LiDAR. Its CW-WDM MSA-compliant DFB laser arrays are a critical enabler for the copper-to-optics transition. Revenue grew 25% in FY2025 with 89% gross margins, but the company is deeply loss-making, over-leveraged, and faces dilution, execution, and competitive risks. Rating: **SPECULATIVE** with potential inflection in 2027-28.

| Metric          | Value                      | Metric            | Value           |

# 1. Executive summary

---

Silvers Semiconductors AB (SIVE.ST) operates through Photonics and Wireless segments, positioning it at the nexus of three technology shifts: the copper-to-optics transition in AI datacenters, 5G/SATCOM mmWave deployment, and solid-state LiDAR [1][2]. The company is a Promoter Member of the CW-WDM MSA standard body, placing it alongside Intel, Lumentum, and MACOM in defining the industry specification for next-generation continuous-wave laser sources [38].

FY2025 revenue reached SEK 304.1M (+25% YoY), with a \$453M opportunity pipeline (+64%) [3]. However, only 28% of revenue comes from recurring product sales; 72% is non-recurring engineering (NRE) [5]. The company posted a net loss of SEK 187M, carries a debt/equity ratio of ~12.4x, and will likely require further dilutive capital raises before reaching breakeven, forecast for approximately 2028 [6][8].

The stock surged ~240% in March 2026 amid speculative trading, with short interest rising to 4.01% and insiders selling into the rally [9]. At P/S ~7.7x, valuation is below photonics peers (10.8x) but nearly 3x the European semiconductor sector average (2.8x). A DCF model estimates fair value at just SEK 1.67 versus ~SEK 11 market price [10].

## 2. Company overview & history

---

Founded in 1951 in Sweden, Silvers has undergone significant transformation over the past decade. The 2017 acquisition of Glasgow-based CST Global (now Silvers Photonics) established its III-V laser foundry capability. The 2022 acquisition of US-based MixComm added mmWave beamforming IC design, US defense relationships, and CHIPS Act access through partnerships with Northrop Grumman, Raytheon, and BAE Systems [12]. The company employs ~130 people across Kista (HQ), Scotland (fab), and the US. Over 65% of revenue originates from the United States [11][13].

## 3. Business segments

---

### 3.1 Photonics

Silvers Photonics designs and manufactures InP-based DFB laser arrays at its 100mm wafer foundry in Scotland. Core markets [1][14]:

- **AI datacenter CPO:** CW-WDM MSA-compliant multi-wavelength DFB laser arrays for co-packaged optics. Anchor partnership with Ayar Labs (NVIDIA-backed) [4][38].
- **LiDAR:** Semiconductor lasers and optical amplifiers for solid-state LiDAR. Customer (likely Aeva Technologies) ramping Q4 2026; \$53-138M cumulative potential [15].
- **Optical sensing:** Custom lasers for three Fortune 100 companies. One customer has placed 130+ MSEK in cumulative development fees [12][13].

### 3.2 Wireless

Silvers Wireless is a fabless designer of mmWave RFICs and beamforming ICs (24-71 GHz), manufactured by GlobalFoundries. Markets include [16][17]:

- **SATCOM:** Ka-band BFICs for LEO/MEO/GEO satellite terminals; ESA and IRIS2 contracts.
- **5G:** Licensed mmWave beamforming transceivers for Tier-1 telecom OEMs (likely Nokia).

- **Defense:** Radar, EW, and tactical comms via CHIPS Act programs [24].
- **FWA:** 60 GHz modules for gigabit broadband (Fujikura, various WISPs) [25].

## 4. Technology thesis: why light replaces copper

In modern AI clusters, ~50% of total system energy is consumed moving data between GPUs, not computing [18]. At next-generation speeds (200+ Gbps/lane), copper interconnects hit fundamental physics limits: reach shrinks below 2 metres, resistance generates waste heat, and signal degradation demands power-hungry correction. With NVIDIA planning to scale GPU clusters from 72 to 576 GPUs by 2027, copper cannot physically keep up [19].

| Attribute            | Copper (legacy)                  | Optical / CPO (Siverts' domain)      |
|----------------------|----------------------------------|--------------------------------------|
| Signal medium        | Electrical current through metal | Photons through glass fiber          |
| Max reach            | <2 metres at next-gen speed      | 50+ metres                           |
| Energy per bit       | High (resistance = heat)         | Low (no electrical resistance)       |
| System power savings | Baseline                         | Up to 30% reduction [20]             |
| Bandwidth density    | Constrained by cross-section     | Scales via wavelength multiplexing   |
| Maturity             | Fully mature, declining returns  | Rapidly maturing; standards evolving |

Figure 1: Copper vs. optical interconnect comparison

Co-packaged optics (CPO) solves this by integrating photonic engines directly alongside the processor, eliminating long copper traces. Every CPO system requires a high-quality continuous-wave (CW) laser as its light source — this is precisely what Siverts manufactures [4][20].

The global optical interconnect market in AI datacenters reached ~\$10B in 2025, projected to hit \$31B by 2033 (15.3% CAGR). The CPO sub-market is forecast to exceed \$20B by 2036 at 37% CAGR [22][39].

## 5. CW laser technology: Siverts' core differentiator

### 5.1 What is a CW laser and why does it matter?

AI datacenter optics rely on two principal laser architectures. Understanding the distinction is essential to evaluating Siverts' competitive position [40]:

| Attribute     | EML (electro-absorption modulated laser)              | CW (continuous-wave) DFB laser                    |
|---------------|-------------------------------------------------------|---------------------------------------------------|
| Function      | Combines laser + modulator on one chip                | Emits steady, unmodulated light beam              |
| Modulation    | Internal (on-chip)                                    | External (via silicon photonics modulator)        |
| Complexity    | Very high — few suppliers can manufacture             | Lower — but precision wavelength control required |
| Key suppliers | Lumentum, Coherent, Mitsubishi, Sumitomo, Broadcom    | Siverts, Lumentum, Coherent, MACOM, Quintessent   |
| Primary use   | Pluggable transceivers (800G/1.6T)                    | Silicon photonics & co-packaged optics (CPO)      |
| Supply status | Critical shortage; NVIDIA has locked up capacity [40] | 5-15% supply deficit; growing demand [21]         |
| Siverts' role | Not a participant                                     | Core product — InP100 DFB laser arrays            |

Figure 2: EML vs. CW laser comparison

A critical market dynamic favours CW lasers: NVIDIA has strategically locked up EML capacity at Lumentum and other suppliers, extending lead times past 2027 [40]. This lock-in has inadvertently accelerated the industry shift toward CW-based silicon photonic solutions — precisely Siverts' specialty. Module manufacturers and cloud providers are actively seeking secondary CW laser suppliers beyond the Lumentum/Coherent duopoly [40].

### 5.2 Siverts' InP100 CW laser platform

Siverts builds its CW DFB laser arrays on its proprietary InP100 platform — a 100mm indium phosphide wafer foundry in Scotland. Key technical specifications [14][38]:

| Parameter              | Specification                                                  |
|------------------------|----------------------------------------------------------------|
| Material system        | Indium phosphide (InP) — III-V compound semiconductor          |
| Wafer size             | 100mm (4-inch) — in-house foundry in Blantyre, Scotland        |
| Standard compliance    | CW-WDM MSA (Promoter Member since founding)                    |
| Wavelength             | O-band, centred at 1300 nm                                     |
| Channel count          | 8-wavelength (2023) progressing to 16-wavelength (2024+)       |
| Output power           | >65 mW per channel in continuous-wave operation                |
| Channel spacing        | 400 GHz                                                        |
| Throughput (with Ayar) | Up to 4 Tbps bidirectional (8-ch); 16 Tbps (16-ch)             |
| Cooling                | Demonstrated operating without active cooling                  |
| Mfg. technique         | Etched-facet lasers with on-wafer optical coatings and testing |
| Capacity expansion     | Qualifying with WIN Semiconductor for additional volume [12]   |

Figure 3: Siverts InP100 CW laser platform specifications

Siverts' wafer-scale manufacturing approach — using etched-facet lasers that can be optically coated and tested on-wafer without cleaving — achieves high yields and lowers packaging costs. This technique was pioneered early by Siverts and gives customers a cost advantage when scaling to volume [12].

### 5.3 The CW-WDM MSA standard

The CW-WDM MSA (Continuous-Wave Wavelength Division Multiplexing Multi-Source Agreement) defines the industry standard for CW laser sources used in silicon photonics and CPO. Silvers Photonics is a **Promoter Member** — meaning it helped author the specification [38]. This is remarkable for a company of its size; the other Promoter Members are [38]:

| Promoter Members                                                                                                                                  | Observer Members                                                                                                                                     |
|---------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| Arista Networks, Ayar Labs, Silvers Photonics, imec, Intel, Lumentum, Luminous Computing, MACOM, Quintessent, Sumitomo Electric, II-VI (Coherent) | NVIDIA, Broadcom, GlobalFoundries, Keysight, NeoPhotonics, Samtec, Scintil Photonics, Tektronix, AMF, Axalume, Furukawa Electric, Coherent Solutions |

Figure 4: CW-WDM MSA membership. Source: [38]

Being a standard-setter confers significant advantages: early access to specification changes, influence over technical direction, and validation as a credible supplier. Customers designing CPO systems to the CW-WDM MSA spec can adopt Silvers' lasers with confidence in interoperability.

5.4 External light source (ELS) architecture

In March 2026, Silvers announced a strategic partnership with O-Net Technologies and Enablence to develop External Light Source (ELS) modules for CPO [39]. ELS physically separates the temperature-sensitive CW lasers from the extreme heat of GPU/switch ASICs, ensuring wavelength stability and improving system reliability — addressing one of CPO's key adoption barriers. The CPO market is projected to exceed \$20B by 2036, with ELS solutions constituting ~10% (\$2B+) [39].

5.5 CW laser competitive positioning

| CW laser supplier | Scale               | Technology                             | Differentiation vs. Silvers                                                          |
|-------------------|---------------------|----------------------------------------|--------------------------------------------------------------------------------------|
| Silvers Photonics | ~\$33M total rev    | InP DFB arrays; InP100 platform        | CW-WDM MSA promoter; Ayar Labs anchor partner; wafer-scale testing; small but nimble |
| Lumentum          | ~\$1.8B rev         | UHP CW laser (1.0W); 16-ch DWDM source | Dominant scale; NVIDIA \$2B deal; 200G EML monopoly; CW-WDM compliant [41]           |
| Coherent (II-VI)  | ~\$5B rev           | InP CW lasers; 25% transceiver share   | NVIDIA Spectrum-X collaborator; broadest optical portfolio [27]                      |
| MACOM             | ~\$700M rev         | Analog/photonic semiconductors         | CW-WDM MSA promoter; strong in high-speed analog [27]                                |
| Sumitomo Electric | Large (diversified) | InP laser expertise                    | Japanese conglomerate; EML and CW supplier; CW-WDM MSA promoter                      |
| Quintessent       | Startup             | Quantum dot heterogeneous integration  | Novel approach; CW-WDM MSA promoter; early stage [38]                                |
| POET Technologies | ~\$5.6M rev         | Optical interposer platform            | Different architecture; Foxconn partnership; early-revenue [27]                      |

Figure 5: CW laser competitive landscape

The laser shortage is a near-term tailwind: global shipments of 800G+ optical transceivers are expected to jump 2.6x from 24M units in 2025 to 63M in 2026, driving upstream demand for CW laser sources that outstrips current supply [40]. Silvers' ability to offer a credible alternative CW source — compliant with the same standard as Lumentum and Coherent — gives module makers and hyperscalers a much-needed second source option.

6. Customer ecosystem

| Customer / partner        | Segment   | Application                  | Status / revenue potential                                               |
|---------------------------|-----------|------------------------------|--------------------------------------------------------------------------|
| Ayar Labs                 | Photonics | AI datacenter CPO lasers     | Strategic partner; NVIDIA-backed; \$870M raised; volume ramp 2027-28 [4] |
| Aeva Tech. (likely)       | Photonics | LiDAR lasers & amplifiers    | Production ramp Q4 2026; \$53-138M cumulative [15]                       |
| O-Net / Enablence         | Photonics | External light source module | New alliance Mar 2026; targeting CPO ELS market [39]                     |
| Fortune 100 (x3)          | Photonics | Optical sensing              | 130+ MSEK cumulative dev fees from one customer [13]                     |
| Tier-1 OEM (likely Nokia) | Wireless  | 5G mmWave infrastructure     | Multi-gen engagement; 3rd gen in development [12]                        |
| ALL.SPACE                 | Wireless  | Multi-orbit SATCOM terminals | Beamforming ICs for smart antennas [12]                                  |
| US defense contractor     | Wireless  | DoD mmWave programs          | Strategic contract Jan 2026; CHIPS Act [24]                              |
| Fujikura / KREEMO         | Wireless  | FWA, V2X, rail               | Volume phase for 60 GHz modules [25]                                     |

Figure 6: Key customer and partner relationships

The Ayar Labs relationship is the most strategically significant. Ayar Labs has raised \$870M total (including a \$500M Series E at ~\$4B valuation) with backing from NVIDIA, AMD, Intel, and MediaTek [12]. Silvers supplies the CW-WDM MSA-compliant DFB laser arrays integrated into Ayar's SuperNova light source, which powers its TeraPHY optical I/O chiplet — the industry's first UCle-compliant optical interconnect delivering 100+ Tbps per accelerator [4][26].

## 7. Competitive landscape

| Competitor       | Overlap          | Revenue | Key differentiator                                              |
|------------------|------------------|---------|-----------------------------------------------------------------|
| Lumentum (LITE)  | Photonics/lasers | ~\$1.8B | NVIDIA's \$2B strategic partner; UHP CW + EML leader [27][41]   |
| Coherent (COHR)  | Photonics/optics | ~\$5B   | Broadest optical portfolio; NVIDIA Spectrum-X collaborator [27] |
| MACOM (MTSI)     | Photonics + RF   | ~\$700M | Most comparable profile; CW-WDM MSA promoter [27]               |
| Analog Devices   | Wireless/RF      | ~\$9B   | Deep RF/microwave IC portfolio [12]                             |
| Qualcomm         | Wireless/5G      | ~\$38B  | Dominant 5G platform; growing mmWave [12]                       |
| Calterah / EdgeQ | mmWave           | Private | Direct-sized competitors in mmWave [28]                         |

Figure 7: Competitive landscape overview

Silvers occupies a rare dual niche spanning photonics and mmWave wireless — described as a 'micro MACOM' [12]. Its competitive edge lies in CW-WDM MSA standard-setting membership, early-mover wafer-scale InP laser manufacturing, and willingness to do custom high-performance design work that giants often decline. The risk: competitors have 40-500x more resources. NVIDIA's \$2B Lumentum investment in March 2026 highlights the scale disparity [27].

## 8. Financial analysis: 3-year review

| Metric (SEK M)   | FY2022 | FY2023     | FY2024   | FY2025 |
|------------------|--------|------------|----------|--------|
| Net sales        | ~133   | 236.3      | 243.7    | 304.1  |
| Revenue growth   | —      | +78%       | +3%      | +25%   |
| Product revenue  | —      | —          | ~76      | 85.7   |
| NRE revenue      | —      | —          | ~168     | 218.4  |
| Gross margin     | ~85%   | ~87%       | ~88%     | ~89%   |
| Adj. EBITDA      | -17.0  | 21.0       | -15.6    | -10.8  |
| EBIT (full year) | —      | neg.       | neg.     | -141.3 |
| Net income (FY)  | —      | -46.4 (Q4) | 4.4 (Q4) | -186.5 |
| EPS (SEK)        | 0.18   | -0.20      | 0.02     | -0.69  |
| Cash position    | —      | —          | —        | 43.5   |

Figure 8: Three-year financial summary. Sources: [3][5][29][30]

FY2023 was a breakout year (+78% revenue; first positive quarterly EBITDA). FY2024 decelerated sharply to +3% growth but delivered positive Q4 cash flow. FY2025 reaccelerated to +25% growth, though losses deepened as R&D; investment intensified (full-year EBIT: -SEK 141M; net loss: -SEK 187M) [3][29][30].

Revenue quality remains the central concern: product revenues were just SEK 85.7M (28%) versus SEK 218.4M (72%) from NRE contracts. Management targets cash flow breakeven at \$50-55M annual revenue with 65% from products — implying product revenues must roughly quadruple [5].

## 9. Key financial ratios & valuation

| Ratio                | Value         | Assessment                                            |
|----------------------|---------------|-------------------------------------------------------|
| P/E (TTM)            | N/A           | Loss-making; no meaningful P/E                        |
| P/S (TTM)            | ~7.7x         | Below peers (10.8x); above EU semi sector (2.8x) [10] |
| P/B                  | ~2.3x         | Moderate for tech                                     |
| Gross margin         | ~89%          | Excellent; strong unit economics                      |
| Operating margin     | -37%          | Deeply negative; heavy R&D spend                      |
| Total debt           | SEK 136M      | Against SEK 25.5M cash [6]                            |
| Debt/equity          | ~12.4x        | Very elevated leverage [6]                            |
| Current ratio        | 1.26x         | Adequate but thin [6]                                 |
| Interest coverage    | -1.7x         | Cannot service debt from operations [6]               |
| Short interest       | 4.01%         | Rising rapidly (from 0.70% YTD) [9]                   |
| Analyst target (avg) | SEK 6.45-6.90 | Below market price ~SEK 11 [31]                       |
| DCF fair value (SWS) | SEK 1.67      | Extreme gap vs. market price [10]                     |

Figure 9: Key financial ratios

## 10. Growth catalysts & path to profitability

| Metric          | FY2025 (actual) | FY2026E | FY2027E | FY2028E     |
|-----------------|-----------------|---------|---------|-------------|
| Revenue (SEK M) | 304             | ~370    | ~507    | ~663        |
| EPS (SEK)       | -0.69           | ~-0.31  | ~-0.02  | ~breakeven+ |

Figure 10: Analyst consensus estimates. Sources: [8][31][32]

| Timeline | Catalyst                                  | Revenue potential                       |
|----------|-------------------------------------------|-----------------------------------------|
| Q4 2026  | LiDAR customer production ramp            | \$53-138M cumulative through 2030+ [15] |
| H2 2027  | CW laser qualification for CPO production | Production-ready status [4]             |
| 2027-28  | NRE-to-product revenue inflection         | Product mix target: 65%+ [5]            |
| 2028     | Volume CPO ramps for AI datacenters       | SAM: \$1.0-1.4B; ELS ~\$2B+ [12][39]    |
| 4-5 yr   | Management 3-4x revenue target            | ~SEK 900M-1.2B [33]                     |

Figure 11: Growth catalyst timeline

Analysts forecast profitability by ~2028, with earnings growing at ~92% per annum and revenue at ~20.5%. The consensus view is that FY2027 is the earliest possible breakeven year, contingent on CPO volume ramps and the NRE-to-product revenue transition [8].

## 11. Peter Lynch framework

| Criterion         | Assessment                                  | Signal                |
|-------------------|---------------------------------------------|-----------------------|
| Category          | Speculative growth / borderline fast grower | Neutral               |
| Revenue CAGR (3Y) | ~29%                                        | Positive              |
| PEG ratio         | N/A — no earnings                           | Negative              |
| Gross margin      | 89%                                         | Positive              |
| Balance sheet     | D/E 12.4x; neg. interest coverage           | Negative              |
| Analyst following | 1-4 analysts (under-followed)               | Positive (contrarian) |
| Insider activity  | Selling during Mar 2026 rally               | Negative              |
| Earnings proof    | Never sustained profitability               | Negative              |
| The 'story'       | AI + 5G + LiDAR megatrends                  | Positive              |

Figure 12: Peter Lynch investment framework

Under Lynch's framework, Silvers is a 'speculative growth' stock lacking the earnings track record he required. His preferred PEG ratio is incalculable. Lynch would be alarmed by the leverage and insider selling, but intrigued by the 89% gross margin and low analyst coverage [9][10].

## 12. Risk factors & bear case

| Risk factor               | Severity | Description                                                                                                                                                           |
|---------------------------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Shareholder dilution      | CRITICAL | History of repeated share issues; 11.8% dilution in 2025 alone. Further raises near-certain given SEK 43.5M cash vs. SEK 136M debt and negative cash flow [7][34].    |
| Revenue quality (72% NRE) | CRITICAL | Only 28% of FY2025 revenue is from products; 72% is one-off engineering work. Product revenue must ~4x to reach breakeven target [5].                                 |
| Speculative price action  | CRITICAL | ~240% surge in one month; 4.01% short interest; insiders selling; analyst targets SEK 6.45-6.90 vs. ~SEK 11 market; DCF fair value SEK 1.67 [9][10][31].              |
| CPO timeline risk         | HIGH     | CPO has been 'imminent' for nearly a decade. Standards, interoperability, and repair complexity (\$100K+ ASIC replacement risk) remain barriers [21][35][36].         |
| Customer concentration    | HIGH     | Growth depends on handful of relationships: Ayar Labs (a startup), one LiDAR customer, one telecom OEM. Q3 2025 missed by 9.4% from single-customer slippage [6][32]. |
| Competitive threat        | HIGH     | NVIDIA invested \$2B in Lumentum (Mar 2026). Coherent, MACOM, Broadcom have 40-500x Silvers' resources. Giants can outspend 50:1 on R&D; [27].                        |
| Fabless dependency        | HIGH     | Wireless chips made by GlobalFoundries; no leverage if foundry prioritises larger customers. Photonics fab is small-scale [6][12].                                    |
| FX exposure               | MEDIUM   | Revenue in USD; reported in SEK. Weakening dollar cost 8pp of growth in FY2025 (25% reported vs. 33% constant FX) [3].                                                |
| Insider selling           | MED-HIGH | Board members, CEO, and major shareholder Kairos Venture sold shares during March 2026 rally [9].                                                                     |
| 'Always almost there'     | HIGH     | 75 years old, never sustainably profitable. Volume ramps consistently described as '18-24 months away' [37].                                                          |

Figure 13: Risk factor assessment

## 13. Conclusion

| Factor        | Bull case                                                                                                | Bear case                                                                                  |
|---------------|----------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------|
| Technology    | Unique photonics+wireless niche; 89% margin; CW-WDM MSA standard-setter; CW laser shortage is a tailwind | CPO delayed repeatedly; competitors have vastly more resources; NVIDIA locking up Lumentum |
| Revenue       | 29% 3Y CAGR; \$453M pipeline; three secular megatrends                                                   | 72% NRE (non-recurring); only 28% product revenue; lumpy and unpredictable                 |
| Profitability | Breakeven forecast ~2028; operating leverage should emerge                                               | Never profitable in 75 years; losses deepening; needs 4x product revenue growth            |
| Balance sheet | 89% gross margin = structural profit pool at volume                                                      | D/E 12.4x; negative interest coverage; further dilution almost certain                     |
| Valuation     | P/S below peer avg; large TAM (\$1B+ CPO by 2028)                                                        | DCF fair value SEK 1.67 vs. ~SEK 11; 240% surge on speculation                             |

Figure 14: Bull/bear assessment summary

Sivers represents a high-conviction, high-risk bet on the AI infrastructure buildout. The technology thesis is structurally sound — the copper-to-optics transition is inevitable, CW lasers are in shortage, and Sivers' CW-WDM MSA promoter status validates its technical credibility. The 89% gross margin demonstrates genuine pricing power.

However, the investment requires accepting multiple concurrent uncertainties: unproven profitability, near-certain further dilution, customer concentration, CPO timeline risk, and the possibility that larger competitors simply outspend Sivers. The March 2026 price surge, insider selling, and divergence from DCF value suggest the market

has priced in a best-case scenario.

Rating: **SPECULATIVE**. Suitable only for investors with high risk tolerance and a multi-year horizon. Potential inflection in 2027-2028, contingent on CPO volume ramps and NRE-to-product transition.
